Thousands of sources behind every briefing

20,000+

PubMed articles matched a single search on type 2 diabetes

459

phase 2 and 3 trials registered for the same condition since 2021

Scattered

Guidelines, trial results and trial registries sit in different places.

Hard to trust

A summary rarely shows which source each statement came from.

Slow to change

A new question or date range means doing the reading again.

A research assistant that shows its sources

Plan
Turns the condition into searches

Collect
Pulls papers from PubMed and trials from ClinicalTrials.gov

Screen
Keeps relevant sources and copies exact quotes

Write and check
Drafts the briefing and checks every quote

Every claim links to a quote
Click a citation to open the source. Each quote is checked word for word against the original.

Ask in plain words
"Why is this in the report?" or "Only use studies from 2024". It re-runs just the affected steps.

Tested on type 2 diabetes, psoriasis, migraine, rheumatoid arthritis and lung cancer.

Value today, and the next steps

What it gives the team

2 min — for a first cited briefing on a new condition

97% — of 640 quotes match the source word for word; the rest are flagged

45 of 45 — companies confirmed against live trial registry data

Next

1. Put it on Google Cloud so the whole team can use it
2. Add our own documents: past strategy memos, service line data
3. Read full-text articles and licensed clinical guidelines
4. Add a clinician review step before a briefing is shared
